

Variable Displacement Pump WA10VSO-31

Size 18~140
 Series 31
 Nominal pressure 280bar
 Peak pressure 350bar
 Swash plate design axial variable piston pump

Features

- Swash plate design axial variable piston pump used in open circuit.
- Continuous work pressure can reach 280bar, The highest instantaneous work pressure can reach 350bar.
- The flow is directly proportional to drive rotate speed and the displacement, and can make stepless variable come true by adjusting the obliquity of the swash plate.
- Wide range of controls such as DR, DFR, DFR1 etc. Short response times.
- Low noise level, High efficiency, High reliability and long time service life.
- Small volume, High power density.
- Excellent oil absorbency.
- Axial and radial loading of drive shaft possible.
- SAE and ISO mounting flange.
- Thru drive option for multi-circuit system.

Construction

Variable Displacement Pump WA10VSO-31

Hydraulic fluid

- The WA10VSO variable displacement pump is suitable for use with mineral oil.

- Operating viscosity range: In order to obtain optimum efficiency and service life, we recommend that the operating viscosity (at operating temperature) be selected from within the range.

V_{opt} =opt. operating viscosity

16---36 mm²/s

Referred to the reservoir temperature (open circuit).

-Viscosity limits

V_{min} =10mm²/s short term at a max. permissible drain of 90 °C.

V_{max} =1000mm²/s short term on cold start

-Temperature range (see selection diagram): t =-25~90°C

-Notes on the selection of the hydraulic fluid.In order to select the correct fluid,it is necessary to know the operating temperature in the tank(open loop) in relation to the ambient temperature.The hydraulic fluid should be selected so that within the operating temperature range, the operating viscosity lies within the optimum range(V_{opt}) (see shaded section of the selection diagram).We recommend that the higher viscosity range should be chosen in each case.

-The finer the filtrationthe better the cleanliness of the pressure fluid and the longer the life of the axial piston unit,to ensure the functioning of the axial piston unit a minimum cleanliness level of:9 to NAS 1638 18/15 to ISO/DIS 4406 is necessary.

Mechanical displacement limiter

Mechanical displacement limiter is possible on the nonthrough-drive model,N00 series but not for the model with through-drive.

V_g max:for size 18 to 140; Setting range V_g max to 50% V_g max stepless

V_g min 50% V_g max; Setting range V_g min to 50% V_g max stepless

Parameter

Operating pressure range - inlet

Absolute pressure at port S

$P_{abs\ min}$ -----0.8 bar

$P_{abs\ max}$ -----30 bar

Operating pressure range - outlet

Pressure at port B

Nominal pressure P_N -----280 bar

Peak pressure P_{max} -----350 bar

Applications with intermittent operating pressures up to 315 bar at 10% duty are permissible.

Case drain pressure

Max.permissible pressure of leakage fluid (at port L,L):Maximum 0,5 bar higher than inlet pressure at port S, but no higher than 2 bar absolute.

Parameter relations

$$\text{Flow } q_v = \frac{V_g \cdot n \cdot \eta_v}{1000}$$

$$\text{Drive Torque } T = \frac{1.59 \cdot V_g \cdot \Delta p}{100 \cdot \eta_{mh}} = \frac{V_g \cdot \Delta p}{20 \cdot \eta_{mh}} \quad [Nm]$$

$$\text{Drive Power } P = \frac{T \cdot n}{9549} = \frac{2\pi \cdot T \cdot n}{60000} = \frac{q \cdot \Delta p}{600 \cdot \eta_t} \quad [kW]$$

$V_g = [cm^3]$ Geometry displacement each rotate

$\Delta p = [bar]$ Pressure drop/differential

$n = [rpm]$ Rotary speed

η_v = Cubage's efficiency

η_{mh} = Mechanical-Hydraulic efficiency

$\eta_t = (\eta_t = \eta_v \times \eta_{mh})$ Overall efficiency

Variable Displacement Pump WA10VSO-31

Installation Notes

Optional installation position. The pump housing must be filled with during commissioning and remain full when operating. In order to attain the lowest noise level, all connections (suction, pressure, case drain ports) must be linked by flexible couplings to tank.

Avoid placing a check valve in the case drain line.

1. Vertical installation (shaft end upwards)

The following installation conditions must be taken into account:

1.1. Arrangement in the reservoir

Before installation fill pump housing, keeping it in a horizontal position.

a) If the minimum fluid level is equal to or above the pump mounting face close port "L" plugged, leave ports "L₁" and "S" open; L piped and recommendation S piped (see Fig. 1).

b) If the minimum fluid level is below the pump mounting face pipe port "L₁" and "S" according to Fig. 2. Close port "L" with respect taking into consideration

1.2. Arrangement outside the reservoir

Before installation fill the pump housing, keeping it in a horizontal position. For mounting above reservoir see Fig. 2.

Limiting condition:

1.2.1. Minimum pump inlet pressure $p_{abs\ min} = 0.8\ bar$ under both static and dynamic conditions.

Note: Avoid mounting above reservoir wherever possible in order to achieve a low noise level.

The permissible suction height h comes from the overall pressure loss, but may not be bigger than $h_{max} = 500\ mm$ (immersion depth $h_{t\ min} = 200\ mm$).

Overall pressure loss

$$\Delta p = \Delta p_1 + \Delta p_2 + \Delta p_3 \leq (1 - p_{abs\ min}) = 0.2\ bar$$

Δp_1 : Pressure loss in pipe due to accelerating column of fluid

$$\Delta p_1 = \rho \times l \times \left(\frac{dv}{dt} \right) \times 10^{-5} \text{ (bar)}$$

ρ = density (kg/m³)
 l = pipe length (m)

dv/dt = rate of change in fluid velocity (m/s²)

Δp_2 = Pressure loss due to static head

$$\Delta p_2 = h \times \rho \times g \times 10^{-5} \text{ (bar)}$$

h = height (m)

ρ = density (kg/m³)

g = gravity = 9.81 m/s²

Δp_3 : Line losses

2. Horizontal installation

The pump must be installed, so that "L" or "L₁" is at the top.

2.1. Arrangement in the reservoir

a) If the minimum fluid level is above the top of the pump, port "L₁" closed, "L" and "S" should remain open, L piped and recommendation S piped (see Fig. 3).

b) If the minimum fluid level is equal to or below the top of the pump, pipe ports "L" and possibly "S" as Fig. 4.; close port "L₁".

The conditions according to item 1.2.1

2.2. Installation outside the reservoir

Fill the pump housing before commissioning. Pipe port "S" and the higher port "L" or "L₁".

a) When mounting above the reservoir, see Fig. 4.

Conditions according to 1.2.1.

b) Mounting below the reservoir

Pipe ports "L" and "S" according to Fig. 5, close port "L₁".

		The pressure controller serves to maintain a constant pressure in a hydraulic system within the control range of the pump. The pump therefore supplies only the amount of hydraulic fluid required by the system. Pressure may be steplessly set at the control valve.	
		Function and equipment as for DR. A pressure relief valve can be connected to port X for remote control applications; this is not included in the items supplied with the DRG control.	
		Function and equipment as far in addition to the pressure control function, the pump flow may be varied by means of a differential pressure over an orifice or valvespool, installed in the service line. The pump flow is equal to the actual required flow by the actuator. The DFR1-valve has no connection between X and the tank.	
		In order to achieve a constant drive torque with a varying operating pressure, the swivel angle and with it the output flow of the axial piston pump is varied so that the product of flow and pressure remains constant. Constant flow control is possible below the power curve.
